SUMMARY

Computer Science student at Pamantasan ng Cabuyao who ships production web systems alongside coursework. Built a browser-based pseudocode-to-Python compiler that runs entirely on the client, a precision-agriculture IoT platform that won the ACCS × Lucky Me idea competition, and two local-first applications designed to keep working without a connection. Comfortable owning a feature end to end, from data model and API design through deployment and testing.

TECHNICAL SKILLS

Languages	TypeScript, JavaScript (ES2022), Java, Python, SQL, HTML/CSS
Frontend	React 18/19, Next.js (App Router), Vite, Tailwind CSS 4, Motion, React Three Fiber
Backend & data	Node.js, Vercel serverless functions, PostgreSQL (Neon), Drizzle ORM, REST APIs, JWT sessions, bcrypt
Offline & storage	IndexedDB, Dexie, Service Workers, progressive web app installability
Tooling & quality	Git, GitHub Actions, Vitest, ESLint, TypeScript strict mode, Vercel

SELECTED PROJECTS

PseudoPy — Pseudocode → Python translation engine and offline-first PWA — pseudopy.me · code

Vanilla JavaScript · Skulpt · Service Worker · IndexedDB · PWA

- Wrote a deterministic translator for IF/ELSE, FOR, WHILE, FUNCTION, SET and DISPLAY that fails with actionable diagnostics rather than silent miscompiles.
- Moved Python execution into the browser with Skulpt, removing the server round-trip and keeping the tool usable with no connection.
- Separated translation, structural analysis and persistence so feedback can fail independently, behind student, instructor and admin dashboards.

AgriGuard — Precision-agriculture IoT platform — code

React · TypeScript · Vite · Tailwind CSS · Vercel Functions · Neon PostgreSQL · Drizzle ORM · JWT

- Won the ACCS × Lucky Me Idea Noodling Competition with a mobile-first dashboard covering sensor monitoring, crop analysis and field alerts.
- Modeled users, IoT devices, sensor readings and alerts as four relational tables with Drizzle migrations and seed data.
- Secured sessions with bcrypt hashes and HTTP-only JWT cookies, and consolidated the API and client into a single Vercel deployment.

CaDeT — Career digital twin with an explainable alignment model — cadetorg.vercel.app · code

React · TypeScript · Vite · Dexie · IndexedDB · Vitest

- Designed a transparent five-signal scoring model (skills 40%, project evidence 25%, experience 15%, ACTOR progress 10%, declared intent 10%) with each contribution rendered in the interface.
- Isolated the what-if simulator on a temporary copy of user data; an accepted simulation is promoted atomically into a real 14-day experiment with tasks, events and stage transitions.
- Kept the app local-first on IndexedDB with no account required, with workflow behaviour covered by Vitest.

WasteLink PH — Offline-first PWA for informal waste pickers — code

React 18 · Vite · IndexedDB · Service Worker · PWA

- Built the data path around a custom service worker and IndexedDB so field records survive intermittent connectivity instead of blocking on a network call.
- Designed a thumb-first, safe-area-aware mobile layout in pure CSS for low-end Android and iOS installs.
- Kept the dependency surface minimal to hold the install size down.

GIAN	Personal finance and net-worth tracker; gianwealth.vercel.app
Scheduler	Scheduling engine packaged as an installable TypeScript PWA; code
LibrarySystem	Object-oriented library management system in core Java; code

EDUCATION

Pamantasan ng Cabuyao — BS Computer Science Present · Expected 2027

College of Computing Studies · Cabuyao, Laguna · Coursework: algorithms, data structures, compiler design, software engineering

AWARDS & RECOGNITION

Champion — The Great Flavor Byte: ACCS × Lucky Me Idea Noodling Competition, for AgriGuard.

Regional tech showcases — Presented PseudoPy and AgriGuard to regional academic and industry audiences.
